In our article entitled “Dissolved organic carbon concentration controls benthic primary production: Results from in situ chambers in north-temperate lakes” (November 2014: 59(6), pp. 2112-2120), we reported on a linear regression between log-transformed photosynthesis-irradiance (*P-I*) parameters. These parameters were not, in fact, log-transformed for this regression. The interpretation of this result is unchanged.

This error affects one sentence in the Methods section, and one in the Results. The sentences should read:

“Simple linear regression analyses were used to compare the light-use efficiencies to average light availability and DOC concentration, the *P-I* parameters (*p*Max, and the half-saturation constant, *K*) to each other, and the log-transformed *P-I* parameters to DOC concentration.” (p. 2114).

“Although our *P-I* parameter estimates should therefore be interpreted with caution, we noted a positive relationship between the *p*Max and *K* estimates ($p < 0.001$) . . .” (p. 2115).
